

ACTIVITY 12

Building Your Portfolio Blog by Prompting an AI Assistant

Portfolio Building • 3rd Semester • B.Tech CSIT

Name	Shrihari H Desai
SRN	R25EJ140
University	REVA University
Branch	B.Tech Computer Science and Information Technology
Mode	Individual
AI / Development Tools	ChatGPT, Antigravity, GitHub, GitHub Pages

This document records the portfolio brief, AI prompting process, review and refinement stages, publication process, final reflection, and visual evidence for Activity 12.

1. Portfolio Brief

Who I am: I am Shrihari H Desai, a B.Tech Computer Science and Information Technology student at REVA University in the 3rd semester. I am interested in programming, problem solving, data, and building practical technology projects.

Academic and technical focus: My current learning focuses on programming fundamentals, data structures and algorithms, databases, software development, and practical work using C, C++, Python, SQL, Git and GitHub.

Course activities represented in the portfolio: The portfolio presents the actual coursework and repository work completed across the earlier portfolio activities. These include the Hello World repository and Git setup, GitLens and Live Share pair-programming collaboration, the LeetCode solutions repository, and the HackerRank 3rd-semester portfolio/coursework entry used in the final site.

Skills: C, C++, Python, SQL, Data Structures and Algorithms, Problem Solving, Git, GitHub, NumPy, Pandas, Matplotlib, and foundational Machine Learning concepts.

Career / learning goal: My current goal is to strengthen programming and problem-solving fundamentals, build practical projects, develop my data and software skills, and prepare for internships and future placement opportunities.

2. Design Brief and Content Direction

- Create a one-page personal portfolio rather than a generic resume page.
- Use a sophisticated black, crimson-red, and off-white visual identity.
- Use strong editorial typography, technical details, subtle 3D depth, and a restrained interactive experience.
- Avoid purple gradients, fake metrics, generic AI slogans, excessive pill buttons, emoji-heavy UI, excessive rounded cards, and unnecessary animation.
- Use a full-screen section sequence so the visitor sees the hero first and then moves through About, Projects, Skills, Trajectory, and Contact using normal mouse-wheel scrolling with smooth section transitions.
- Use only factual information supplied for the portfolio and do not invent achievements, statistics, internships, companies, testimonials, or contact information.

3. AI Prompt and Refinement Log

The portfolio was developed through iterative prompting. The following log records the major prompts and the visible change produced by each stage.

1. Initial generation / anti-vibe-coding direction

Prompt: Build a professional, clean, minimal one-page personal portfolio blog for a B.Tech Computer Science student. Make it feel intentional, human-designed, professional and academically credible. Avoid purple gradients, fake metrics, vague hero slogans, unnecessary emoji icons, em dashes, excessive animations, fake testimonials, invented achievements and generic filler. Use only the factual portfolio brief.

What changed: Established the factual content rules and prevented the first version from becoming a generic AI/vibe-coded portfolio.

2. 3D portfolio redesign

Prompt: Redesign the existing portfolio substantially with a sophisticated 3D-inspired portfolio, strong visual identity, dark editorial styling, layered depth, a subtle 3D object or technical structure, interactive project presentation, and restrained motion. Preserve factual content and working links.

What changed: Moved the page from a plain white portfolio toward a more distinctive 3D/editorial presentation.

3. Red + black correction

Prompt: Replace the entire blue colour system with a RED + BLACK colour system. Use deep black, dark charcoal, deep crimson red, restrained bright red, and off-white text. There must be no blue, cyan, navy, purple, or rainbow gradients.

What changed: Established the final black + crimson-red visual identity.

4. Full-screen scrolling experience

Prompt: Make the website behave like a sequence of full-screen sections. The first screen must show my name and introduction. When the visitor scrolls with the mouse wheel, transition smoothly into About, Projects, Technical Skills, Current Trajectory, and Contact. Use CSS scroll snapping or another lightweight accessible approach.

What changed: Created the section-by-section scrolling experience and section indicators.

5. Skills and trajectory refinement

Prompt: Make Technical Skills and Career / Learning Goal more visually engaging than plain columns. Use a subtle terminal/typewriter or technical presentation for skills and an editorial CURRENT TRAJECTORY sequence for goals. Keep motion restrained and use only actual skills and goals.

What changed: Improved the two previously static areas with a more technical/editorial presentation.

6. Deployment prompt

Prompt: Deploy the existing pure Vanilla HTML/CSS/JavaScript portfolio to the GitHub Pages repository shriharidesai209-commits.github.io. Use index.html, styles.css and script.js; exclude Vercel and IDE files; verify the live URL and working links.

What changed: Connected the finished static portfolio to GitHub and published it through GitHub Pages.

4. Generation Review and Final Implementation

- The generated site was reviewed against the content brief rather than being accepted as a first-draft output.
- The visual direction was refined from a simple portfolio into a dark technical/editorial interface with crimson-red accents and a 3D geometric core.
- The hero section was made the first viewport so the visitor immediately sees the student's name, degree, university, introduction, and 3D visual.
- The site uses full-screen sections with section numbering and smooth scroll snapping.
- Projects and activities are presented as distinct entries with repository/profile links.
- The skills area uses categorized technical presentation instead of fake proficiency percentages.
- The trajectory section presents the learning direction as Strengthen, Build, Explore, and Prepare.
- The final site was checked locally and then published as a static GitHub Pages site.

5. Final Portfolio Structure

01	Portfolio Overview	Name, degree, university, introduction, 3D technical core
02	About	Academic and personal context
03	Projects & Activities	Coursework repositories, collaboration, LeetCode and HackerRank portfolio work
04	Technical Skills	Programming, foundations, Python/Data
05	Current Trajectory & Goals	Strengthen, Build, Explore, Prepare + profile links

6. Publication Details

Repository	shriharidesai209-commits.github.io
Branch	main
Published files	index.html, styles.css, script.js
Excluded	vercel.json, .git, IDE/temporary files
Live URL	https://shriharidesai209-commits.github.io

7. Reflection

The biggest improvement came from the refinement prompts that changed the portfolio from a basic page into a dark, red-and-black technical portfolio with 3D depth and smooth section transitions. The AI initially produced visual directions that were too generic and later needed explicit constraints on colour, motion, and common AI/vibe-coded patterns. The iterative prompts helped me learn that a detailed design brief produces a more controlled result than a vague request. I also learned to review AI output against the original requirements instead of accepting the first generated version.

8. Final Submission Checklist

- Portfolio brief prepared with personal information, Activities 1–4, skills, and learning goal.
- Initial structured AI generation prompt documented.
- Multiple follow-up refinement prompts documented with the change produced.
- Final portfolio published on GitHub Pages.
- Live portfolio URL verified.
- Screenshots captured as supporting evidence.
- Repository About section contains the live portfolio link.

Live Portfolio: <https://shriharidesai209-commits.github.io>

9. Visual Evidence

The following screenshots document the final published portfolio sections. They are included as supporting evidence; the activity brief itself lists the portfolio brief, prompt log, and live page as the required deliverables.
